So, the optical fiber transmits "data" by light to a receiving end, where the light signal is decoded as data. Therefore, fiber optics is actually a transmission medium - a "pipe" to carry signals over long distances at very high speeds. Fiber optic cables were originally developed in the 1950s for endoscopes.

How does fiber optics work? - Explain that Stuff

An optical fiber (or fibre in British English) is a flexible, transparent fiber made by drawing glass or plastic to a diameter slightly thicker than that of a human hair. Optical fibers are used most often as a means to transmit light between the two ends of the fiber and find wide usage in fiber-optic communications, where they permit transmission over longer distances and at higher ...
