Probability Theory And Examples Solution

Solution: Taking the individual probabilities of each number, getting a 2 is $1/6$ and so is getting a 5. Applying the formula of compound probability, Probability of getting a 2 or a 5, $P(2 \text{ or } 5) = P(2) + P(5) - P(2 \text{ and } 5) \Rightarrow 1/6 + 1/6 - 0. \Rightarrow 2/6 = 1/3.$

Let X_1, X_2, X_3, X_4 be independent and take values 1 and -1 with probability $1/2$ each. Let $Y_1 = X_1 X_2, Y_2 = X_2 X_3, Y_3 = X_3 X_4,$ and $Y_4 = X_4 X_1.$ It is easy to see that $P(Y_i = 1) = P(Y_i = -1) = 1/2.$ Since $Y_1 Y_2 Y_3 Y_4 = 1, P(Y_1 = Y_2 = Y_3 = 1, Y_4 = -1) = 0$ and the four random variables are not independent.

And if we cannot compute the solution we might be able to obtain an answer to our questions using computer simulations. Moreover, the notes introduce probability theory as the foundation for doing statistics. The probability theory will provide a framework, where it becomes possible to clearly formulate our statistical questions

Probability Theory and Statistics

Probability is the study of chance or the likelihood of an event happening. Directly or indirectly, probability plays a role in all activities. For example, we may say that it will probably rain today because most of the days we have observed were rainy days.
