Therefore, when solving quadratic equations by factoring, we must always have the equation in the form " $(\text{quadratic expression}) = 0$ " before we make any attempt to solve the quadratic equation by factoring. Returning to the exercise: The Zero Factor Principle tells me that at least one of the factors must be equal to zero.

Solving Quadratic Equations by Factoring. From the example above, the quadratic problem simply reduces to a linear problem which can be solved by simple factorization. Example 1: Given x

Download Ebook Solving Quadratic Equations By Factoring Worksheet With Answers

$x^2 + 5x + 6 = 0$ $\left(x + 3\right)\left(x + 2\right) = 0$ (factoring the polynomial)
 $\left(x + 3\right) = 0$ OR $\left(x + 2\right) = 0$. Thus $x = -3$, Or $x = -2$. The example above shows that it is indeed easy to solve quadratics by factoring method. However, the method only works for the most basic equations.

This page will try to solve a quadratic equation by factoring it first. How does this work? Well, suppose you have a quadratic equation that can be factored, like $x^2 + 5x + 6 = 0$. This can be factored into $(x+2)(x+3) = 0$. So the solutions must be $x = -2$ and $x = -3$. Note that if your quadratic equation cannot be factored,
